49	FALSE
50	FALSE

I. CHOOSE THE BEST ANSWER FOR EACH QUESTION (6 marks)

1. What part of a computer stores data permanently?
A. network interface card B. secondary storage C. CPU D. primary storage

2. The fundamental conceptual unit in a computer is _____.
A. CPU B. Hard Drive C. Operating System D. Transistor

3. Approximately how many bytes make one Megabyte?
A. One Million B. One Thousand C. Ten Thousand D. One Hundred

4. Which device allows your computer to talk to other computers over a telephone line as well as access the internet?
A. CD-ROM drive B. RAM C. Modem D. Hard Drive

5. With these systems, input and output devices are located outside the system unit.
A. Desktop systems B. Personal digital assistants
C. Smartphones D. Laptop computers

6. Which of the following offers a combination of the features of RAM and ROM?
A. DRAM B. DDR C. Flash Memory D. Cache

7. Most microcomputers allow users to expand their systems by providing these on the system board.
A. expansion slots B. ports C. sound cards D. modem cards

8. This type of monitor is common on desktop computers. It looks much like a standard television.
A. cathode-ray tube B. flat-panel C. monochrome D. projector

9. Monitors use various intensities of _____ colors to generate the rainbow.
A. 16 B. 16 million C. three D. four

10. Newer projectors utilize _____ to achieve clearer and brighter images.
A. mirrors B. thin-film transistors
C. digital light processing D. cathode ray tubes

11. A _____ is an example of a solid-state memory device.
A. flash memory drive B. CD-RW C. floppy disk D. hard disk

12. Floppy drives, hard drives and tape drives all use a _____ to read data.
A. laser B. magnet C. sensor D. pen

13. Disk defragmentation software allows you to _____.
A. destroy files stored on your hard drive.
B. physically destroy computer hard drives, CD and DVDs.
C. collect broken files and fix them.
D. maximise space on your hard drive by organising files.

14. As a victim of identity theft, how would you attempt to resolve your dilemma?
A. Ask someone else to collect your mail. B. Change your bank account details.
C. Prove yourself innocent to avoid financial costs. D. Have someone impersonate you.

15. The main interface in Windows and OS X is a (an) _____ interface.
A. embedded B. graphical C. command-line D. neural

16. The program that allows the OS to work with a printer or a video card is a(n) _____.
A. driver B. utility C. applet D. system call

17. A program currently loaded in the system but not active is said to be running in the _____.
A. user session B. kernel C. background D. foreground

18. Data that is copied from an application is stored in the _____.
A. driver B. clipboard C. terminal D. prompt

19. The last member of the Windows 9X family is _____.
A. Windows XP B. Windows 95 C. Windows 98 D. Windows ME

20. Office LANs that are spread geographically apart on a large scale can be connected using a corporate _____.
A. CAN B. LAN C. DAN D. WAN

21. What is the process of copying software programs from secondary storage media to the hard disk called?
A. storage B. download C. configuration D. upload

22. The WWW standard allows programmers on many different computer platform to how the information on a server. Such programmers are called _____.
A. ISP B. Web Browsers C. Web Servers D. Web Modular

23. Which process checks to ensure the components of the computer are operating and connected properly?
A. Editing B. Processing C. Saving D. Booting

24. A software/hardware mechanism that private networks use to block unauthorized traffic from the internet.
A. a padlock B. a firewall C. a virus scanner D. a privacy protector

25. Which input device cannot be used to work in MS Office?
A. Scanner B. Light Pen C. Mouse D. Joy Stick

26. A commonly used graphic format for the web is _____.
A. GIF B. bmp C. Imp D. TIF

27. What does HTTP stand for?
A. Hyper Translation Protocol B. Hyper Typical Text Protocol
C. Hyper Text Transfer Protocol D. Hyper Text Transforming Protocol

28. What does ADSL stand for?
A. Asymmetric Digital Subscriber Line B. Asymmetric Digital Signal Line
C. A Digital Super Line D. Analog Dimension Super Long

29. A good solution to overcome network bandwidth limitations is to _____.
A. increase network connections.
B. reduce the size of files and increase the number of files being transmitted.
C. decrease the capacity of the communications media within the network.
D. increase the capacity of the communications media within the network.

30. Viruses, worms or Trojans can be named as _____.
A. harmware B. shockwave C. malware D. software

II. READING COMPREHENSION (4 marks) *Read the 3 passages and answer the questions.*

Passage 1: ***Questions 31-35 refer to the following passage.***

Telecommuting – substituting the computer for the trip to the job – has been hailed as a solution to all kinds of problems related to office work. For workers it promises freedom from the office, less time wasted in traffic, and help with child - care conflicts. For management, telecommuting helps keep high performers on board, minimizes tardiness and absenteeism by eliminating commutes, allows periods of solitude for high - concentration task, and provides scheduling flexibility. In some areas, such as Southern California and Seattle, Washington, local governments are encouraging companies to start telecommuting programs in order to reduce rush - hour congestion and improve air quality. But these benefits do not come easily. Making a telecommuting program work requires careful planning and an understanding of the differences between telecommuting realities and popular images.

Many workers are seduced by rosy illusions of life as a telecommuter. A computer programmer from New York City moves to the tranquil Adirondack Mountains and stays in contact with her office via computer. A manager comes in to his Office three days 8 week and works at home the other two. An accountant stays home to care for child; she hooks up her telephone modem connections and does office work between calls to the doctor.

These are powerful images, but they are a limited reflection of reality. Telecommuting workers soon learn that it is almost impossible to concentrate on work and care for a young child at the same time. Before a certain age, young children cannot recognize. Much less respect, the necessary boundaries between work and family. Additional child support is necessary if the parent is to get any work done.

Management, too, must separate the myth from the reality. Although the media has paid a great deal of attention to telecommuting. In most cases it is the employee's situation, not the availability of technology that precipitates a telecommuting arrangement.

That is partly why, despite the widespread press coverage, the number of companies with work-at-home programs or policy guidelines remains small.

31. What is the main subject of the passage?

A. Business management policies
B. Driving to work
C. Extending the workplace by means of commuters
D. Commuters for child - care purposes

32. Which of the following is NOT mentioned as a problem for office employees?

A. Being restricted to the office
B. Incurring expenses for lunches and clothing
C. Taking care of sick children
D. Driving in heavy traffic

33. Which of the following is NOT mentioned as a problem for employers that is potentially solved by telecommuting?

A. Employees' lateness for work
B. Employees' absence from work
C. Employees' need for time alone to work intensively
D. Employee's' conflicts with second jobs

34. Which of the following does the author mention as a possible disadvantage of telecommuting?

A. Small children cannot understand the boundaries of work and play.
B. Computer technology is not advanced enough to accommodate the needs of every situation.
C. Electrical malfunctions can destroy a project.
D. The worker often does not have all the needed resources at home.

35. Which of the following is an example of telecommuting as described in the passage?

A. A scientist in a laboratory developing plans for a space station

B. A technical writer sending via computer documents created at home

C. A computer technician repairing an office computer network

D. A teacher directing computer-assisted learning in a private school

==========

Passage 2:

The average computer user has between 5 and 15 username/password combinations to log in to email accounts, social networking sites, discussion boards, news and entertainment sites, online stores, online banking accounts, or other websites. For people who use email or other internet applications at work, the number of required username/password combinations may surpass 30. Some of these accounts demand that you use a specific number of symbols and digits, while others require you to change your password every 60 days. When you add to this list the codes needed to access things like ATMs, home alarm systems, padlocks, or voicemail, the number of passwords becomes staggering. The feeling of frustration that results from maintaining a memorized list of login credentials has grown so prevalent that it actually has a name: password fatigue.

Having to remember so many different passwords is irritating, but it can also be dangerous. Because it is virtually impossible to remember a unique password for each of these accounts, many people leave handwritten lists of usernames and passwords on or next to their computers. Others solve this problem by using the same password for every account or using extremely simple passwords. While these practices make it easier to remember login information, they also make it exponentially easier for thieves to hack into accounts.

Single sign-on SSO. authentication and password management software can help mitigate this problem, but there are drawbacks to both approaches. SSO authentication can be used for related, but independent software systems. With SSO, users log in once to access a variety of different applications. Users only need to remember one password to log in to the main system; the SSO software then automatically logs the user in to other accounts within the system. SSO software is typically used by large companies, schools, or libraries. Password management software, such as KeePass and Password Safe, is most often used on personal computers. These software programs—which have been built into many major web browsers—store passwords in a remote database and automatically "remember" users' passwords for a variety of sites.

The problem with both SSO authentication and password management software is that the feature that makes them useful is also what makes them vulnerable. If a user loses or forgets the password required to log in to SSO software, the user will then lose access to all of the applications linked to the SSO account. Furthermore, if a hacker can crack the SSO password, he or she will then have access to all of the linked accounts. Users who rely on password management software are susceptible to the same problems, but they also incur the added threat of passwords being compromised because of computer theft.

Although most websites or network systems allow users to recover or change lost passwords by providing email addresses or answering a prompt, this process can waste time and cause further frustration. What is more, recovering a forgotten password is only a temporary solution; it does not address the larger problem of password fatigue.

Some computer scientists have suggested that instead of passwords, computers rely on biometrics. This is a method of recognizing human users based on unique traits, such as fingerprints, voice, or DNA. Biometric identification is currently used by some government agencies and private companies, including the Department of Defense and Disney World. While biometrics would certainly eliminate the need for people to remember passwords, the use of biometrics raises ethical questions concerning privacy and can also be expensive to implement.

The problems associated with SSO, password management software, and biometrics continue to stimulate software engineers and computer security experts to search for the cure to

password fatigue. Until they find the perfect solution, however, everyone will simply have to rely on the flawed password system currently in place.

==========

36. Which of the following best describes the organization of the passage?

A. The passage organizes ideas in order of increasing importance.

B. The author presents an argument and then uses evidence to dismiss opposing views.

C. The author explains a problem, explores solutions, and then dismisses these solutions as inadequate.

D. The author explains a problem and then persuades readers to agree with his or her solution to the problem.

37. The passage discusses all of the following solutions to password fatigue except _____.

A. intelligent encryption **B.** voice-recognition software

C. KeePass **D.** using very simple passwords

38. According to the passage, SSO authentication software may be safer than password management software because _____.

I. stolen personal computers contain passwords memorized by a user's web browser

II. if a user of password management software forgets his or her login credentials, the user can no longer access any of the applications protected by the password

III. hackers who access password management software can gain access to all of the applications protected by that password

A. I only **B.** II only **C.** I and II only **D.** II and III only

39. Which of the following statements from the passage represents an opinion, as opposed to a fact?

A. "For people who use email or other internet applications at work, the number of required username/password combinations may surpass 30."

B. "The feeling of frustration that results from maintaining a memorized list of login credentials has grown so prevalent that it actually has a name: password fatigue."

C. "Having to remember so many different passwords is irritating, but it can also be dangerous."

D. "Additionally, recovering a forgotten password is only a temporary solution; it does not address the larger problem of password fatigue."

40. In paragraph 6, the author notes that "the use of biometrics raises ethical questions concerning privacy." Which of the following situations could be used as an example to illustrate this point?

A. A thief steals a personal computer with password management software and gains access to private email accounts, credit card numbers, and bank statements.

B. An employee at a company uses a voice recognition system to log in to his computer, only to be called away by his boss. While he is away from the computer but still logged in, another employee snoops on his computer and reads personal email correspondence.

C. A computer hacker gains access to a system that uses SSO software by cracking the password, thus gaining private access to all linked accounts.

D. A company that employs fingerprint identification security software turns over its database of fingerprints to the local police department when a violent crime occurs on its grounds.

Passage 3: Questions 41-50 refer to the following passage.

Computers Make the World Smaller and Smarter

The ability of tiny computing devices to control complex operations has transformed the way many tasks are performed, ranging from scientific research to producing consumer products. Tiny 'computers on a chip' are used in medical equipment, home appliances, cars and toys. Workers use handheld computing devices to collect data at a customer site, to generate forms, to control inventory, and to serve as desktop organisers.

Not only is computing equipment getting smaller, it is getting more sophisticated. Computers are part of many machines and devices that once required continual human supervision and control. Today, computers insecurity systems result in safer environments, computers in cars improve energy efficiency, and computers in phones provide features such as call forwarding, call monitoring, and call answering.

These smart machines are designed to take over some of the basic tasks previously performed by people; by so doing, they make life a little easier and a little more pleasant. Smart cards store vital information such as health records, drivers' licenses, bank balances, and so on. Smart phones, cars, and appliances with built in computers can be programmed to better meet individual needs. A smart house has a built-in monitoring system that can turn lights on and off, open and close windows, operate the oven, and more.

With small computing devices available for performing smart tasks like cooking dinner, programming the VCR, and controlling the flow of information in an organization, people are able to spend more time doing what they often do best - being creative. Computers can help people work more creatively. Multimedia systems are known for their educational and entertainment value, which we call 'edutainment'. Multimedia combines text with sound, video, animation, andgraphics, which greatly enhances theinteraction between user and machine andcan make information more interesting andappealing to people. Expert systems softwareenables computers to 'think' like experts.Medical diagnosis expert systems, forexample, can help doctors pinpoint apatient's illness, suggest further tests, andprescribe appropriate drugs.

Connectivity enables computers and software that might otherwise be incompatible to communicate and to share resources. Now that computers are proliferating in many areas and networks are available for people to access data and communicate with others, personal computers are becoming interpersonal PCs. They have the potential to significantly improve the way we relate to each other. Many people today telecommute - that is, use their computers to stay in touch with the office while they are working at home. With the proper tools, hospital staff can get a diagnosis from a medical expert hundreds or thousands of miles away. Similarly, the disabled can communicate more effectively with others using computers.

Distance learning and videoconferencing are concepts made possible with the use of an electronic classroom or boardroom accessible to people in remote locations. Vast databases of information are currently available to users of the Internet, all of whom can send mail messages to each other. The information superhighway is designed to significantly expand this interactive connectivity so that people all over the world will have free access to all these resources.

People power is critical to ensuring that hardware, software, and connectivity are effectively integrated in a socially responsible way. People - computer users and computer professionals - are the ones who will decide which hardware, software, and networks endure and how great an impact they will have on our lives. Ultimately people power must be exercised to ensure that computers are used not only efficiently but in a socially responsible way.
